1 Exponential and Logarithmic Equations

Exponential equations

MATH 1510

Lili Shen

Exponential
and
Logarithmic
Equations

An **exponential equation** is one in which the variable occurs in the exponent.

Some exponential equations can be solved by using the fact that exponential functions are one-to-one, i.e.,

$$a^x = a^y \iff x = y.$$

Exponential equations

MATH 1510

Lili Shen

Exponential
and
Logarithmic
Equations

Example

Solve the exponential equation

$$3^{x+2} = 7.$$

Exponential equations

MATH 1510

Lili Shen

Exponential
and
Logarithmic
Equations

Solution.

$$\begin{aligned}3^{x+2} &= 7, \\ \log_3 3^{x+2} &= \log_3 7, \\ x + 2 &= \log_3 7, \\ x &= \log_3 7 - 2.\end{aligned}$$

Exponential equations

MATH 1510

Lili Shen

Exponential
and
Logarithmic
Equations

In this example,

$$x = \log_3 7 - 2$$

is the **exact solution** of the equation $3^{x+2} = 7$.

Using calculators, one could find an **approximation** to the exact solution by the change of base formula:

$$x = \log_3 7 - 2 = \frac{\ln 7}{\ln 3} - 2 \approx -0.228756.$$

Exponential equations

MATH 1510

Lili Shen

Exponential
and
Logarithmic
Equations

Example

Solve the equation

$$e^{2x} - e^x - 6 = 0.$$

Exponential equations

MATH 1510

Lili Shen

Exponential
and
Logarithmic
Equations

Solution.

$$\begin{aligned}e^{2x} - e^x - 6 &= 0, \\(e^x - 3)(e^x + 2) &= 0, \\e^x = 3 \quad \text{or} \quad e^x &= -2.\end{aligned}$$

Since $e^x > 0$, one could only have $e^x = 3$ and consequently

$$x = \ln 3.$$

Logarithmic equations

MATH 1510

Lili Shen

Exponential
and
Logarithmic
Equations

A **logarithmic equation** is one in which a logarithm of the variable occurs.

Some exponential equations can be solved by using the fact that logarithmic functions are one-to-one, i.e.,

$$\log_a x = \log_a y \iff x = y.$$

Logarithmic equations

MATH 1510

Lili Shen

Exponential
and
Logarithmic
Equations

Example

Solve each equation for x .

(1) $\ln x = 8$.

(2) $\log_2(25 - x) = 3$.

Logarithmic equations

MATH 1510

Lili Shen

Exponential
and
Logarithmic
Equations

Solution.

(1)

$$e^{\ln x} = e^8,$$

$$x = e^8.$$

(2)

$$\log_2(25 - x) = 3,$$

$$2^{\log_2(25-x)} = 2^3,$$

$$25 - x = 8,$$

$$x = 17.$$

Compound interest

MATH 1510

Lili Shen

Exponential
and
Logarithmic
Equations

If a principal P is invested at an annual interest rate r for a period of t years, then the amount A of the investment is given by

- $A(t) = P(1 + rt)$ (simple interest),
- $A(t) = P\left(1 + \frac{r}{n}\right)^{nt}$ (interest compounded n times per year),
- $A(t) = Pe^{rt}$ (interest compounded continuously).

Compound interest

MATH 1510

Lili Shen

Exponential
and
Logarithmic
Equations

Example

A principal P is invested at an interest rate r per year. Find the time required for the money to double if the interest is

- (1) simple,
- (2) compounded semiannually,
- (3) compounded continuously.

Compound interest

MATH 1510

Lili Shen

Exponential
and
Logarithmic
Equations

Solution.

Suppose that the money will be double after t years.

(1) Simple interest:

$$P(1 + rt) = 2P,$$

$$1 + rt = 2,$$

$$t = \frac{1}{r}.$$

Compound interest

MATH 1510

Lili Shen

Exponential
and
Logarithmic
Equations

(2) Interest compounded semiannually:

$$P\left(1 + \frac{r}{2}\right)^{2t} = 2P,$$

$$\left(1 + \frac{r}{2}\right)^{2t} = 2,$$

$$\log_{1+\frac{r}{2}}\left(1 + \frac{r}{2}\right)^{2t} = \log_{1+\frac{r}{2}} 2,$$

$$2t = \log_{1+\frac{r}{2}} 2,$$

$$t = \frac{1}{2} \log_{1+\frac{r}{2}} 2.$$

Compound interest

MATH 1510

Lili Shen

Exponential
and
Logarithmic
Equations

(3) Interest compounded continuously:

$$Pe^{rt} = 2P,$$

$$e^{rt} = 2,$$

$$\ln e^{rt} = \ln 2,$$

$$rt = \ln 2,$$

$$t = \frac{\ln 2}{r}.$$

Compound interest

MATH 1510

Lili Shen

Exponential
and
Logarithmic
Equations

For example, if the annual interest rate is 5%, the number of years t needed to double an investment is:

(1) Simple interest:

$$t = \frac{1}{r} = \frac{1}{0.05} = 20.$$

(2) Interest compounded semiannually:

$$t = \frac{1}{2} \log_{1+\frac{r}{2}} 2 = \frac{\ln 2}{2 \ln 1.025} \approx 14.04.$$

(3) Interest compounded continuously:

$$t = \frac{\ln 2}{r} = \frac{\ln 2}{0.05} \approx 13.86.$$
